(57) **ABSTRACT**

A method for generating a preamble sequence in an orthogonal frequency division multiplexing (OFDM) communication system having A subcarriers in a frequency domain. The method comprises generating a length -MxN preamble sequence, where MxN is less than A, by using a length-N Golay complementary sequence and a length-M Golay complementary sequence; and assigning elements constituting the preamble sequence to MxN subcarriers among the A subcarriers on a one-to-one mapping basis, assigning null data to the remaining subcarriers excluding the MxN subcarriers from the A subcarriers, and then IFFT-transforming the assigned result into time-domain data.
